- 6 Conclusions

# Definition

Set  $U$  of *units* with a total order relation  $\prec$

## Tree

- ▶ Node: subset of  $U$ , represented as a *unit list*

$$a = (u_i)_{i=1,\dots,n} \quad u_1 \prec u_2 \prec \dots \prec u_n$$

- ▶ Children of a node  $a$ :

$$a \cup \{u_{n+1}\} \quad \forall u_{n+1} : u_n \prec u_{n+1}$$

- ▶ Root: the empty set  $a = \emptyset$

# Bounding the cost

Goal: tree traversal up to given cost target  $T$

## Cost-related functions

- ▶ Cost function:  $\gamma(a)$  (e.g.  $w^{\text{rev}}(a) + w^{\text{dir}}(a)$ )
- ▶ Cost bounding function:  $L(a)$  s.t.

$$\gamma(a') \geq L(a) \quad \text{for all descendants } a' \text{ of } a$$

$\Rightarrow$  Prune all the subtrees with  $L(a) > T$

# Example: active bit positions

# Outline

- 1 Differential trails
- 2 Tree search
- 3 Bounds in KECCAK- $f$**
- 4 Experimental results
- 5 Symmetry properties
- 6 Conclusions

KECCAK- $f$ 

Operates on 3D state:

- ▶  $(5 \times 5)$ -bit **slices**
- ▶  $2^\ell$ -bit **lanes**
- ▶ parameter  $0 \leq \ell < 7$

Round function with 5 steps:

- ▶  $\theta$ : mixing layer
- ▶  $\rho$ : inter-slice bit transposition
- ▶  $\pi$ : intra-slice bit transposition
- ▶  $\chi$ : non-linear layer
- ▶  $\iota$ : round constants

# rounds:  $12 + 2\ell$  for width  $b = 2^\ell 25$

- ▶ 12 rounds in KECCAK- $f[25]$
- ▶ 24 rounds in KECCAK- $f[1600]$

[Bertoni, Daemen, Peeters, Van Assche, 2008]

# Properties of $\theta$

- ▶ The  $\theta$  map adds a pattern, that depends on the parity, to each plane.
- ▶ **Affected** columns are complemented
- ▶ **Unaffected** columns are not changed

# The parity Kernel

- ▶  $\theta$  acts as the identity if parity is zero
- ▶ A state with parity zero is **in the kernel** (or in  $|K|$ )
- ▶ A state with parity non-zero is **outside the kernel** (or in  $|N|$ )

# Differential trails in KECCAK-f

Round: linear step  $\lambda = \pi \circ \rho \circ \theta$  and non-linear step  $\chi$

- ▶  $a_i$  fully determines  $b_i = \lambda(a_i)$
- ▶  $\chi$  has degree 2:  $w(b_{i-1})$  independent of  $a_i$
- ▶ Minimum reverse weight:

$$w_{rev}(a_1) \triangleq \min_{b_0} w(b_0)$$

# Differential trails in KECCAK-f

$$w(Q) = w(b_0) + w(b_1) + w(b_2) + w(b_3)$$

$\rightarrow$   $\lambda$   $\rightarrow$   $\chi$   $\rightarrow$   $\lambda$   $\rightarrow$   $\chi$   $\rightarrow$   $\lambda$   $\rightarrow$   $\chi$   $\rightarrow$   $\lambda$   $\rightarrow$

$a_0$   $b_0$   $a_1$   $b_1$   $a_2$   $b_2$   $a_3$   $b_3$

Round: linear step  $\lambda = \pi \circ \rho \circ \theta$  and non-linear step  $\chi$

- ▶  $a_i$  fully determines  $b_i = \lambda(a_i)$
- ▶  $\chi$  has degree 2:  $w(b_{i-1})$  independent of  $a_i$
- ▶ Minimum reverse weight:

$$w_{rev}(a_1) \triangleq \min_{b_0} w(b_0)$$

# Differential trails in KECCAK-f

$$w(Q) = w_{rev}(a_1) + w(b_1) + w(b_2) + w(b_3)$$

Round: linear step  $\lambda = \pi \circ \rho \circ \theta$  and non-linear step  $\chi$

- ▶  $a_i$  fully determines  $b_i = \lambda(a_i)$
- ▶  $\chi$  has degree 2:  $w(b_{i-1})$  independent of  $a_i$
- ▶ Minimum reverse weight:

$$w_{rev}(a_1) \triangleq \min_{b_0} w(b_0)$$

# Covering the space of 6-round trail cores

## Lemma

A 6-round trail of weight  $W$  always contains a 3-round trail of weight below or equal to  $\lfloor \frac{W}{2} \rfloor$

# Covering the space of 3-round trail cores

$$w(Q) = w_{\text{rev}}(a_1) + w(b_1) + w(b_2)$$

- ▶ Space split based on parity of  $a_i$
- ▶ Four classes:  $|K|K|$ ,  $|K|N|$ ,  $|N|K|$  and  $|N|N|$

# Covering the space of 3-round trail cores

$$w(Q) = w_{\text{rev}}(a_1) + w(b_1)$$

The diagram shows a red square labeled with the Greek letter lambda ( $\lambda$ ). An arrow points from the left into the square, and another arrow points from the square to the right. Below the left arrow is the label  $a_1$ , and below the right arrow is the label  $b_1$ .

- ▶ Generating  $(a_1, b_1)$
- ▶ Extending forward by one round

# Covering the space of 3-round trail cores

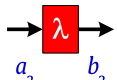

$w(Q) =$

- ▶ Generating  $(a_1, b_1)$
- ▶ Extending forward by one round

# Covering the space of 3-round trail cores

$w(Q) =$

$$w_{\text{rev}}(a_2) + w(b_2)$$

The diagram shows a red square labeled with the Greek letter lambda (λ) in the center. An arrow points from the left into the square, and another arrow points from the right out of the square. Below the left arrow is the label  $a_2$ , and below the right arrow is the label  $b_2$ .

- ▶ Generating  $(a_2, b_2)$
- ▶ Extending backward by one round

# Covering the space of 3-round trail cores

$w(Q) =$

- ▶ Generating  $(a_2, b_2)$
- ▶ Extending backward by one round

# Orbitals

►  $orbital = [z, x, y_1, y_2]$

# Orbitals (continued)

►  $y'_1 > y_2$

# Generating trail cores in $|K|$

- ▶ Root: the empty state
- ▶ Units: *orbitals* =  $[z, x, y_1, y_2]$
- ▶ Bound: cost of the node itself

# Parity-bare states

Parity-bare state: a state with the minimum number of active bits before and after  $\theta$  for a given parity

- ▶ 0 active bits in unaffected even columns
- ▶ 1 active bit in unaffected odd column
- ▶ 5 active bits in affected column either before or after  $\theta$

States in  $|N|$ 

## Lemma

*Each state can be decomposed in a unique way in a parity-bare state and a list of orbitals*

States in  $|N|$ 

## Lemma

*Each state can be decomposed in a unique way in a parity-bare state and a list of orbitals*

# Orbital tree

- ▶ Root: a parity-bare state
- ▶ Units: orbitals in unaffected columns
- ▶ Bound: cost of the trail itself

# Run tree

- ▶ Root: the empty state
- ▶ Units: column assignments ( $x$ ,  $z$ , odd/affected, column value)
- ▶ Bound: cost minus potential loss due to new CAs

## Trail extension

# Tree-search on affine space

- ▶ Affine space:  $o + \langle b_1, \dots, b_m \rangle$

$$a = o + \sum_j \alpha_j b_j$$

- ▶ Unit set  $U = \{b_1, \dots, b_m\}$
- ▶ Root:  $a = o$
- ▶ Node:  $a = (b_i) : \alpha_i = 1$
- ▶ Define  $L(a)$  to take advantage of stable active bits

# Outline

- 1 Differential trails
- 2 Tree search
- 3 Bounds in  $\text{KECCAK-}f$
- 4 Experimental results**
- 5 Symmetry properties
- 6 Conclusions

# Experimental results

- ▶ All 3-round trail cores with weight  $\leq 45$

- ▶ No 6-round trail with weight  $\leq 91$

## Trails for parity profile

## Bounds

rounds	$b = 200$	$b = 400$	$b = 800$	$b = 1600$
2	8	8	8	8
3	20	24	32	32
4	46	[48,63]	[48,104]	[48,134]
5	[50,89]	[50,147]	[50,247]	[50,372]
6	[92,142]	[92,278]	[92,556]	[92,1112]
$n_r$	[276,·]	[280,·]	[292,·]	[368,·]

# Outline

- 1 Differential trails
- 2 Tree search
- 3 Bounds in  $\text{KECCAK-}f$
- 4 Experimental results
- 5 Symmetry properties**
- 6 Conclusions

# Invariance by translation or rotation

E.g., in KECCAK- $f$ ,  $w(\tau_z a) = w(a)$  for any translation  $\tau_z$  along  $z$

# Canonicity

## Canonical representation

- ▶ Define an order relation on states
- ▶ Define the canonical representation as the minimum one, e.g.,

$$a \text{ canonical} \Leftrightarrow a = \min_z \tau_z a$$

# Tree search restricted to canonical representations

## Reminder

- ▶ Set  $U$  of units with a total order relation  $\prec$
- ▶ Unit list:  $a = (u_i)_{i=1,\dots,n}$  with  $u_1 \prec u_2 \prec \dots \prec u_n$

## Lemma

*Assuming that*

- ▶  $\prec_{\text{lex}}$  *is the lexicographic order on unit lists*
- ▶ *canonicity is defined w.r.t.  $\prec_{\text{lex}}$*

*then the parent of a canonical pattern is canonical.*

$\Rightarrow$  Complete non-canonical subtrees can be pruned

[Mella, Daemen, Van Assche, FSE 2017]

# Testing for canonicity

## Basic algorithm

- ▶ Input: unit list  $a = (u_i)_{i=1,\dots,n}$
- ▶ For each  $i$ 
  - ▶ Transform  $a$  such that  $\tau(u_i)$  is  $\prec$ -minimum
  - ▶ Sort the resulting unit list
  - ▶ Compare it (using  $\prec_{\text{lex}}$ ) to the currently minimum unit list
- ▶ Output: canonical representation (or just true/false)

# Outline

- 1 Differential trails
- 2 Tree search
- 3 Bounds in  $\text{KECCAK-}f$
- 4 Experimental results
- 5 Symmetry properties
- 6 Conclusions**

# Can the tree search be applied to your cipher?

- ▶ How to represent differences in a monotonic way?
- ▶ Can symmetry properties be exploited?
- ▶ Code available on
